

Don't push a jig's data to a public repository by accident

A jig's data goes into its repository with it, so a push to a public repository asks first: declining sends nothing. And a file bigger than a git service accepts is refused before anything is sent, rather than failing halfway.

Don't push a jig's data to a public repository by accident

A jig’s data goes into its repository with it, so a push to a public repository asks first: declining sends nothing. And a file bigger than a git service accepts is refused before anything is sent, rather than failing halfway.

What you can count on

- Pushing a jig with data to a public repository asks first, and declining sends nothing
- A file over 100 MB is refused before anything is sent

Where it works

In the desktop app and on the command line. Each of these is checked, on every surface named, by the ozwala-usecases harness.
