

Keep a second machine up to date without thinking about it

A jig installed on a machine follows its repository by itself: when an agent starts Ozwala's MCP server, and when the app opens, a jig with something new is updated and its skills re-synced. Switched off -- for the jig -- it stays where it is. The state file is removed between checks to stand in for the six hours that would otherwise pass.

Keep a second machine up to date without thinking about it

A jig installed on a machine follows its repository by itself: when an agent starts Ozwala's MCP server, and when the app opens, a jig with something new is updated and its skills re-synced. Switched off -- for the jig -- it stays where it is. The state file is removed between checks to stand in for the six hours that would otherwise pass.

What you can count on

- A jig that has changed on its repository is updated, skills and all, when an agent starts ozwala mcp
- A jig that has changed on its repository is updated when the app opens, and its status says so
- With auto-update off for the jig, nothing moves

Where it works

In the desktop app and on the command line. Each of these is checked, on every surface named, by the ozwala-usecases harness.
