Publish a jig you authored, and have someone else install it

A user who has built a jig and keeps it in a git repository lists it on the members' site and publishes it. A second user finds it in ozwala.com's public directory, follows its repository link, and installs it into their own desktop app from that link.

The site lists jigs by repository URL; it stores no archives. The chain this proves is listing -> directory -> repository link -> install, and the handoff from the web to the app is the URL a visitor would actually follow.

What you can count on

- A jig published on emc appears in ozwala.com's public directory
- The public listing links to the repository the author gave
- A second user installs the published jig, from its listing, into a fresh home

Where it works

On ozwala.com and in the desktop app. Each of these is checked, on every surface named, by the ozwala-usecases harness.
